

PMS-EDEN – Model Specification

A PMS-conform application profile (overlay) for structural drift in praxis: Eden → threshold → NRK → comparison-frame dominance → pseudo-symmetry → asymmetry-switch availability → PFO / permanentized exception → parity-to-exit / responsibility-to-authority → residual stabilization ($\Delta/\Phi/A$) → devaluation/humiliation → reciprocity loss, with strict separation between descriptive mapping and PMS-valid binding application ($X + \text{reversibility} + D$). No person-typing, diagnosis, ideology attribution, maturity ranking, or how-to guidance.

Version: PMS-EDEN_1.2 · Spec basis: PMS-EDEN.yaml

Author: T. Zöllner · Formalisation assistance: ChatGPT (GPT-5.4 Thinking)

Language: EN · Status: Model spec (aligned with `schema_meta.status = "draft"`)

Last updated: 2026-05-24

Depends on: PMS.yaml (`schema_version = "PMS_1.3"`)

Repo: <https://github.com/tz-dev/PMS-EDEN>

1. Purpose and scope of this specification

This document specifies the *PMS-EDEN* layer in a concise, technical form. It is based on the YAML profile *PMS-EDEN.yaml* (with `schema_version = "PMS-EDEN_1.2"`) and renders its structure, constraints, and semantics explicit for human readers and computational systems.

PMS-EDEN is an **application profile** (overlay) of the Praxeological Meta-Structure (PMS; $\Delta-\Psi$). It does **not** redefine PMS operators, dependencies, layers, or derived axes. Instead, it formalizes an **Eden drift lens**: a structurally minimal grammar for how a praxis configuration can drift into comparison governance, pseudo-symmetry, asymmetry-switch availability, permanentized exception, responsibility displacement, residual stabilization, devaluation or humiliation, and reciprocity loss—read strictly as operator configurations ($\Delta-\Psi$) under asymmetry (Ω), temporality (Θ), distance (X), integration (Σ), and self-binding (Ψ).

All PMS-EDEN labels remain **paper-internal, descriptive, scene-bound, revisable, and non-totalizing**. They are not PMS operators, not diagnoses, not ideology labels, not person categories, not essence claims, and not authority claims.

The specification covers, in particular:

- the **schema_meta** block (identity, status, authorship, dependency on PMS_1.3, authoritative source-paper role);
- the **validity_gate** enforcing X (Distance), reversibility, and D (Dignity-in-Practice) for PMS-valid application only;
- **paper-internal terms** from §0.7: asymmetry switch, permanentized exception switch, parity-to-exit, and responsibility-to-authority;
- **paper constructs** (NRK, PS, PFO, reciprocity, devaluation, humiliation, adult reciprocity as non-externalization) as non-operators;
- **reduced signatures** and the **drift catalogue**, including the updated master trace with explicit switch drift and residual stabilization;
- **viability** as paper-bound cost/coordination readout under PMS criteria as used in this paper;
- **EDEN-MAP** as scene-bound mapping protocol with Q1–Q7, including switch-drift scan and diagnostics-to-action firewall;
- **pattern library** with pattern-status clarification and paper-internal composite discipline;
- **glossary handles** (stable refs; canonical text remains in the paper);
- **alternative explanations** (methodological discipline box; sufficiency, no ranking, including AE4 external institutional stress);
- **boundary conditions** (scope discipline, rival-framework openness, genuine non-capture, strongest-

applicability summary);

- **appendix positioning** (adjacent frameworks, non-goals, classification risk controls, theory-adjacent stance);
- **example-suite schema** (repo vignettes; scene-bound, non-instructional, dignity-preserving, switch-drift-aware).

Core idea drift as operator-carriage

PMS-EDEN treats “Eden” as a minimal structural testbed: a praxis-first scene where drift becomes legible by tracking what operators carry, fail to carry, displace, or simulate. The overlay’s job is to keep the analysis structural, scene-bound, auditable, revisable, rival-framing-open, and dignity-preserving while making switch drift, cost geometry, and reciprocity loss inspectable.

2. High-level structure of the YAML model

2.1 Top-level keys (conceptual map)

Key	Description	Role in the model
schema_version	Version identifier ("PMS-EDEN_1.2").	Compatibility and citation
schema_meta	Model identity, authors, status, dependency on PMS_1.3, repo references, source-paper metadata.	Meta-information / inheritance statement
abbrev_legend	Named abbreviations and paper-internal label discipline, including AS, PES, PTE, RTA, PS, PFO, NRK, and EDEN-MAP.	Terminology normalization
validity_gate	Application-only validity clause: X + reversibility + D.	Formal application firewall
operator_reference	Canonical PMS operator source, fixed set, and dependency hygiene note.	PMS conformance anchor
references	Repository and model references.	Traceability / linking
paper_frontmatter_min	Load-bearing claims, PMS conformance, ACRED references, minimal paper terms.	Frontmatter compression layer
paper_internal_terms_index	Stable §0.7 handles for asymmetry switch, permanentized exception switch, parity-to-exit, and responsibility-to-authority.	Update-specific term discipline
overlays	Reserved overlay namespace; currently empty in the profile.	Future-safe structural namespace
paper_constructs	Paper-internal constructs (EDEN, threshold, breach, fig leaves, NRK, PS, AS, PES, PTE, RTA, PFO, reciprocity, devaluation, humiliation) as non-operators.	Structural construct layer
reduced_signatures	Reduced operator-readable signatures, compact traces, viability proposals.	Orientation and shorthand layer
drift_catalogue	Consolidated corridors, regimes, and chapter-level drift handles, including updated master trace and switch drift branches.	Drift legibility layer
pattern_library	Paper-internal composites with C5 pattern discipline and revisability notes.	Portable recognition layer
viability	Minimal viability/cost windows; structural cost marker 16.25.	Cost-bearing coordination discipline
eden_map	Scene-bound mapping protocol: cartographic status, scene packet, Q1–Q7, synthesis, firewall.	Operational method scaffold
glossary_index	Stable paper-internal handles/refs for glossary entries; avoids duplicating full paper text.	Terminology discipline + retrieval keys
alternative_explanations	Methodological discipline: multiple sufficient generators; no ranking; includes AE4 external institutional stress.	Anti-overclaim guard
boundary_conditions	Conditions where drift weakens, changes, or rival frameworks/non-capture limit applicability.	Scope discipline
appendices	Positioning layer: adjacent frameworks, non-goals, classification risk controls.	Repository-facing interpretability
example_suite_schema	Repo vignette blocks: minimal scene, mapping, costs, pattern markers, switch-drift markers, gate reminder, closure.	Example library format
paper_structure_map	Coverage index for complete paper-to-YAML section mapping.	Coverage / auditability layer

Conceptual separation PMS vs PMS-EDEN

PMS defines the operator grammar (Δ – Ψ) and derived axes (A, C, R, E, D). PMS-EDEN defines a drift-reading discipline: Eden sequences, frames, non-events, regimes, switch availability, costs, reciprocity loss,

and mapping protocol—without introducing new operators, new axioms, or person-level explanations.

3. Validity gate and scope constraints

3.1 PMS-valid application gate

- **X (Distance):** maintain meta-position and reflective stop-capability; no fusion into verdict, urgency, enforcement, role, accusation, or person-level attribution.
- **Reversibility:** all readings remain scene-bound, revisable, non-final, and configuration-specific; no global person labels or irreversible interpretive capture.
- **D (Dignity-in-Practice):** no shaming, ranking, humiliation, diagnosis, maturity hierarchy, dignity hierarchy, or ontological person evaluation; critique targets enacted structures and cost handling only.

3.2 Explicit non-goals (overlay discipline)

- no clinical, therapeutic, or forensic use;
- no personality typing, motive theory, or inner-state claims;
- no prescriptive “how-to” or coercive action demands;
- no moral ranking of persons; no ontological dignity judgments;
- no ideology-based attribution: regimes are defined by operator behavior only;
- no automatic extension into scenes better captured by rival frameworks or genuine non-capture cases;
- no conversion of asymmetry switch into authority;
- no use of parity-to-exit as reciprocity;
- no use of responsibility-to-authority as care, protection, or adult responsibility.

Key firewall description vs PMS-valid application

PMS-EDEN allows sharp descriptive mapping: operators, costs, drift signatures, switch handles, and regime configurations. The moment the mapping is used to bind, obligate, prescribe, enforce, rank, diagnose, or authorize control, the validity gate is active. Bypassing X, reversibility, or D makes the move formally invalid as PMS application—even if the descriptive analysis is accurate.

4. PMS-EDEN as a structural configuration (spine, master trace, regimes)

4.1 Canonical PMS spine (orientation)

$\Delta \rightarrow \nabla \rightarrow \square \rightarrow \wedge \rightarrow A \rightarrow \Omega \rightarrow \Theta \rightarrow \Phi \rightarrow X \rightarrow \Sigma \rightarrow \Psi$

4.2 Master trace (Eden drift corridor)

Core corridor (operator-readable; non-moral)

Eden $\rightarrow$ Threshold $\rightarrow$ NRK $\rightarrow$ $\square$ comparison $\rightarrow$ PS $\rightarrow$ ASYMMETRY_SWITCH_AVAILABILITY $\rightarrow$ PFO/
PERMANENTIZED_EXCEPTION $\rightarrow$ (PARITY_TO_EXIT | RESPONSIBILITY_TO_AUTHORITY) $\rightarrow$
residual_stabilization($\wedge/\Phi/A$) $\rightarrow$ (DEVALUATION | HUMILIATION) $\rightarrow$ RECIPROCITY_LOSS

PMS-EDEN treats this as a repeatable structural corridor within this reconstruction: a sequence that can stabilize as scripts (A), especially when Ω becomes legible in consequences but illegible in speech under the dominant $\square$. Switch availability and residual stabilization ($\wedge/\Phi/A$) are kept explicit rather than compressed away.

4.3 Paper-internal composites (non-operators)

NRK (Negative Responsibility Kernel)

Breach-type label: enactment occurs while awareness options are available, yet Σ/Ψ do not carry the enactment. NRK is a paper-internal composite descriptor, not a PMS operator.

PS (Pseudo-Symmetry)

Rhetorical equality inside a comparison-dominant $\square$ under real Ω in consequences, with Σ blocked or simulated and Ψ misbound to appearance-management. In the updated profile, PS also prepares switch availability when parity remains the surface grammar while Ω becomes selectively activatable.

AS / Asymmetry switch

Paper-internal label for the shift from parity claim to asymmetry activation under real or invoked Ω/Θ pressure. Valid only where activation is marked, bounded, and re-bound into Σ/Ψ ; drifting where unmarked, repeatable, and responsibility-shifting.

PES / Permanentized exception switch

PFO drift form in which asymmetry activation ceases to be emergency-bound and becomes a standing lever while parity remains rhetorically preserved and Σ/Ψ coordination remains blocked.

PTE / Parity-to-exit

Drift pattern in which parity or symmetry language is used not to coordinate reciprocity, but to deny additional responsibility under unequal Ω/Θ consequences.

RTA / Responsibility-to-authority

Drift pattern in which required self-binding under asymmetry is converted into control, protection entitlement, frame authority, or governance. Greater responsibility under asymmetry does not generate authority.

PFO (Postfeminist Override / Over-steering)

Paper-internal regime label for a regime-level meta-frame: $\square$ is configured as comparison metric + Ω -taboo + permanentized exception-switch availability. $\Phi/\wedge/A$ stabilize while Σ is suppressed and Ψ is displaced or misbound. Defined only by operator behavior; not ideological; not a group label.

Humiliation / devaluation (structural use)

Paper-internal meaning: status regulation via devaluation as residual stabilization when explicit Ω -coordination via Σ/Ψ is blocked. This is a structural consequence claim, not an intent, motive, trait, or moral verdict.

Adult reciprocity principle

PMS-EDEN defines reciprocity as coordinated asymmetry, not symmetry: Σ under Ω , bound by Ψ across Θ , limited by X , constrained by D . Adult reciprocity does not require equal burdens; it requires non-externalization of unequal burdens.

Non-promissory stance

PMS-EDEN is descriptive and criterial: it makes drift, switch mechanics, and cost geometry inspectable. It does not offer optimization, therapy, instruction, or authority claims. Where "correction signatures" are mentioned, they are viability descriptions only and remain subject to the validity gate.

5. EDEN-MAP (method appendix): scene-bound mapping protocol

EDEN-MAP is a structural mapping protocol for PMS-EDEN analyses. It identifies operator configurations (Δ - Ψ) in a given scene **without diagnosing persons**. It is question-driven and includes a mandatory diagnostics-to-action firewall.

Cartographic status not a closed ontology

EDEN-MAP is not a closed ontology of relational breakdown. It is a cartographic compression of the structural patterns reconstructed in PMS-EDEN. Its purpose is to increase portability, comparability, and auditability, not to claim that every relevant case is already exhausted by its map-space.

The map remains revisable, scene-dependent in application, and open to rival framings and genuine non-capture. The more portable the map becomes, the greater the risk that compression is mistaken for structural completeness.

5.1 Minimal unit: Scene Packet (15.2)

SceneID: { $\emptyset$ window, $\square$ anchor, roles}

Trigger: { Δ , ∇ } · Λ **candidates:** [...]

Realizations: {observed, omissions, escalations}

E-check: { $E_{\text{present?}}$, $\Sigma_{\text{carrier?}}$, notes} (discipline: realization $\neq$ E without Σ -carriage)

A stabilizers: [...] · Ω **real:** {capacity, exposure, obligation, leverage}

Ψ map: {declared, enacted, enforced, externalized} (incl. $\Psi \rightarrow$ Other demands)

Switch map: {asymmetry_activation, parity_to_exit, responsibility_to_authority, re_binding}

5.2 Core questions Q1–Q7 (15.3)

▼ Q1 — Which frame ($\square$) dominates?

Identify the dominant relevance grammar ($\square$ praxis, $\square$ comparison, $\square$ moral, $\square$ security, $\square$ scarcity, $\square$ narrative, or hybrid). Output: $\square_{\text{dominant}} = \langle \text{type/hybrid} \rangle +$ what is permitted, forbidden, speakable, or punishable.

► Q2 — What asymmetry (Ω) is real, and how is it handled?

Map gradients: capacity, exposure, obligation, leverage. Record whether Ω is nameable/coordinable, taboo, selectively activated, weaponized, or unclear under $\square$. Output: $\Omega_{\text{real}} = \{\text{capacity, exposure, obligation, leverage}\} + \Omega\text{-handling} = \langle \text{coordinated|taboo|selectively_activated|weaponized|unclear} \rangle$.

► Q3 — Which Λ is active and how is it handled?

Identify the active non-event (reply/repair/recognition/coordination/commitment missing) and closure mode (denial, minimization, moralization, displacement, pseudo-closure). Output: Λ_{active} / $\Lambda_{\text{handling}}$ / $\Lambda_{\text{remainder}}$.

► Q4 — Where is X missing or instrumentalized?

Identify where distance is absent or punished and where “distance” is used as control (erasing Λ , avoiding Σ while keeping leverage, protecting a switch surface). Output: X_{absent} / $X_{\text{instrumental}}$ / $X_{\text{restoration}}$.

► Q5 — Where is Σ low, failed, suppressed, or simulated?

Record integration status and blockers ($\square/\Omega/\Lambda/\Theta$). Output: Σ_{status} / Σ_{blockers} / Σ_{minimum} .

► Q6 — Who self-binds (Ψ), and who externalizes binding ($\Psi \rightarrow$ Other)?

Map declared vs enacted vs enforced binding; identify $\Psi \rightarrow$ Other demands. Output: Ψ_{self} / Ψ_{external} / Ψ_{repair} (repair = shift from other-control to self-binding under D).

► Q7 — Does switch drift appear?

Test whether asymmetry activation is marked, bounded, and re-bound into Σ/Ψ , or whether drift appears as unmarked asymmetry activation, parity-to-exit, or responsibility-to-authority. Output: $\text{switch_drift} = \{\text{asymmetry_activation, parity_to_exit, responsibility_to_authority, re_binding}\}$.

5.3 One-page synthesis (15.4)

Required synthesis fields

Drift = $\square$ dominant $\rightarrow$ Λ handling $\rightarrow$ A stabilizer $\rightarrow$ Ω management/switch_drift $\rightarrow$ Σ status $\rightarrow$ Ψ pattern

Aprimary (what repetition stabilizes the configuration)

Costs = {A, C, R, E, D} (system costs; non-moral)

LowestCostCorrection = {Xstep, $\Lambda \rightarrow \Sigma$ step, switch_step, Ψ shift} (descriptive viability signature; not a prescription)

Switch step in synthesis

switch_step means: mark, bound, and re-bind asymmetry activation; block parity-to-exit and responsibility-to-authority; preserve X, reversibility, and D. It is a viability signature, not an instruction or enforcement license.

Mandatory firewall (15.5)

The restrictions in this section apply to PMS-valid application, not to all possible discourse about persons, scenes, or institutions. EDEN-MAP is not a person-evaluation tool. It permits scene-bound structural mapping, drift-risk and cost geometry, scene-bound switch-drift handles, and reversible dignity-preserving viability signatures. It forbids global person labels, inner-state claims, clinical categories, coercive prescriptions justified by PMS vocabulary, or converting responsibility into authority over another role-position.

6. Terminology discipline (paper-internal handles and glossary)

PMS-EDEN uses paper-internal structural terms as operator-conform composites or strict definitions (non-psychological, non-diagnostic). The YAML stores stable *handles* and refs rather than duplicating the full paper text.

6.1 §0.7 paper-internal term handles

Handle	Meaning (structural; summary)	Discipline
0.7_ASYMMETRY_SWITCH	Shift from parity claim to asymmetry activation under real or invoked Ω/Θ pressure.	Valid only where marked, bounded, and re-bound into Σ/Ψ ; drift where unmarked, repeatable, and responsibility-shifting.
0.7_PERMANENTIZED_EXCEPTION_SWITCH	PFO drift form in which asymmetry activation ceases to be emergency-bound and becomes a standing lever under preserved parity surface.	Not a person label; describes regime availability of unmarked activation.
0.7_PARITY_TO_EXIT	Drift pattern in which parity rhetoric is used to deny additional responsibility under unequal Ω/Θ consequences.	Responsibility-displacement pattern, not a person label.
0.7_RESPONSIBILITY_TO_AUTHORITY	Drift pattern in which required self-binding under asymmetry is converted into control, frame authority, protection entitlement, or governance.	No authority follows from responsibility; not a person label.

6.2 §16 glossary handles

Handle	Meaning (structural; summary)	Operator anchor
A (Awareness)	Sustained, framed differentiation across time (availability, not phenomenology).	$[\Theta, \square, \Delta]$
E (Action)	Integrated enactment; realization $\neq$ E unless Σ carries it.	$[\Sigma, \Theta, \nabla]$
PS (Pseudo-Symmetry)	Rhetorical parity under real Ω ; switch availability may emerge; Σ bypassed or simulated; Ψ misbound to appearance-management.	$\square_{\text{comparison}} + \Omega + \Sigma$ $\text{low} + \Psi \text{ misbound}$
PFO (paper-internal regime label)	Ω -illegibility / Ω -taboo regime with comparison, permanentized exception-switch availability, high Φ , retained Λ , suppressed Σ , displaced or misbound Ψ , and A protocolization.	$\square(\Omega\text{-taboo} + \text{comparison} + \text{switch}) + \Phi + \Lambda + A$; Σ/Ψ suppressed
NRK (Composite)	Breach type: enactment under available awareness where Σ/Ψ do not carry.	A available; Σ/Ψ failed/aborted/externalized/displaced/simulated
Reciprocity	Coordinated asymmetry, not symmetry. Adult reciprocity does not require equal burdens; it requires non-externalization of unequal burdens.	Σ under Ω ; Ψ across Θ ; X ; D
Devaluation	Lowering standing-in-practice as control move substituting for coordination when Σ/Ψ cannot consolidate under named Ω .	$\square + A + \Lambda$ under blocked Σ/Ψ
Structural Drift Cost Marker	Warning handle for drift regimes sustained by cost externalization: low/simulated Σ , displaced or externalized Ψ , suppressed Ω -legibility or Ω activated without re-binding, parity-to-exit, responsibility-to-authority, retained Λ , protocolized A, accumulated Θ costs.	$\Omega \leftrightarrow \Theta$ with chronic Λ ; Σ/Ψ displaced; costs accumulate

Scope note

Everyday connotations ("maturity," "humiliation," "responsibility," "authority," etc.) are explicitly overridden: PMS-EDEN uses these as paper-internal structural terms about in-scene consequence handling, not about inner states, traits, motives, ideology, moral worth, or person status.

7. Drift catalogue (corridors, regimes, switch drift, reciprocity loss)

Drift markers are configuration statements ("in this scene, the following operators are carrying / failing to carry..."), not person labels. The catalogue consolidates predictable consequences of operator constellations under repetition and time.

7.1 Core drift corridor (compressed)

```
Eden → Threshold → NRK → □comparison → PS → ASYMMETRY_SWITCH_AVAILABILITY → PFO/  
PERMANENTIZED_EXCEPTION → (PARITY_TO_EXIT | RESPONSIBILITY_TO_AUTHORITY) →  
residual_stabilization(Λ/Φ/A) → (DEVALUATION | HUMILIATION) → RECIPROCITY_LOSS
```

7.2 Regime-level repeatability (PFO as meta-frame)

▼ PFO — paper-internal regime label; repeatability without ideology attribution

PFO denotes a dominant □ configured as Ω-illegibility / Ω-taboo + comparison metric + permanentized exception-switch availability, with high Φ (continuous recontextualization), persistent Λ (non-closure as remainder or leverage), and stabilized A scripts. Σ and Ψ remain suppressed, displaced, or misbound, so reciprocity cannot consolidate. This is defined only by operator behavior, not political identity, ideology, group membership, or person type.

7.3 Switch drift branches

Branch	Drift form	Validity condition / failure point
ASYMMETRY_SWITCH	Asymmetry is activated under real or invoked Ω/Θ pressure.	Valid where marked, bounded, and re-bound into Σ/Ψ; drift where unmarked, repeatable, and responsibility-shifting.
PERMANENTIZED_EXCEPTION	Exception-switch becomes standing regime availability under parity surface.	Fails where asymmetry activation is no longer emergency-bound or coordinatively re-bound.
PARITY_TO_EXIT	Parity or equality language exits responsibility under unequal Ω/Θ consequences.	Fails where equality-language replaces cost re-internalization.
RESPONSIBILITY_TO_AUTHORITY	Required Ψ/X responsibility is converted into authority, protection entitlement, control, or governance.	Fails where responsibility stops being self-binding and becomes authorization.

7.4 Reciprocity loss (tragedy, not guilt)

► Reciprocity = coordinated asymmetry (PMS-EDEN definition)

Reciprocity = Σ under Ω, bound by Ψ across Θ, limited by X. Loss of reciprocity is readable as collapse of these carriers under comparison-dominant □ plus chronic Λ across Θ. Under the switch extension, reciprocity also fails where parity becomes exit, asymmetry becomes leverage, or responsibility becomes authority.

Cost marker (non-moral)

Where mappings repeatedly show suppressed Ω-legibility, unmarked Ω activation without re-binding, low or simulated Σ, Ψ→Other externalization or Ψ misbinding, parity-to-exit, responsibility-to-authority, chronic Λ, and stabilized A scripts, PMS-EDEN treats the configuration as a drift regime sustained by asymmetric cost carriage. This is a structural non-viability signal under PMS criteria as used in this paper, not a moral verdict.

8. Pattern library (portable recognition, not diagnosis)

The pattern library collects paper-internal composites that bundle recurrent operator constellations into portable analytical forms. Patterns are recognition aids. They are not independent ontological entities, not diagnostic categories, not person labels, and not enforcement licenses.

8.1 C5 pattern schema

Trigger configuration · Primary stabilizer · Primary failure

8.2 Pattern index

Pattern	Name	Compressed reading
P-Ω-AC	Ω → Covert Authority	Real Ω is not coordinated as functional gradient and becomes covert authority via □-control and A steering.
P-Λ-DN	Λ → Denial / Suppression	Remainder is treated as non-existent; Φ supplies pseudo-closure; A stabilizes avoidance while Λ persists.
P-Σ-TOT	Σ → Totalization	Closure demand turns Σ-language into final-answer script; X is suppressed and D is endangered.
P-Ψ-EXT	Ψ → Externalization	Binding is displaced onto another role-position instead of carried as Ψ→Self under X and D.
P-□-MOR	□ → Moral Frame Capture	Frame shifts into moral adjudication; operator-reading collapses into verdict, guilt, rank, or person capture.
P-Σ-SIM	Σ-Simulation instead of Integration	Coordination is performed discursively while interfaces do not change and remainder persists.

Revisability note
The pattern library does not claim formal completeness. It organizes the major drift patterns reconstructed in the paper and remains revisable under counter-scenes, rival framings, and cases of genuine non-capture.

9. Scope discipline: alternative explanations and boundary conditions

9.1 Alternative explanations (methodological discipline)

PMS-EDEN explicitly lists alternative sufficient generators to prevent over-claiming. No refutation is attempted; no ranking is implied. Alternatives are phrased in role/gradient language (Ω -capacity/exposure/leverage positions), not group labels. All AE use remains scene-bound and structurally revisable.

AE1 — Drift without regime

Pair-dynamics under stable $\square$ comparison can generate monitoring, pseudo-symmetry, chronic Λ , and A scripts without a regime layer.

AE2 — Drift via Ω overextension

Drift can begin when the most Ω -salient position mis-handles leverage without X/D, triggering counter-control and frame shift.

AE3 — Drift without humiliation

Stabilization can occur via withdrawal, exit, or isolation rather than humiliation: X increases as withdrawal; Θ locks separation.

AE4 — External institutional stress

Drift can be driven by institutional scarcity, compliance, sanction logics, throughput pressure, or administrative overload rather than by a locally stabilized regime logic; A then stabilizes procedural survival scripts.

9.2 Boundary conditions (where the pipeline weakens)

Boundary condition	Effect on PMS-EDEN drift claims
Ω minimal or absent	Asymmetry-driven drift mechanisms lose their primary generator; applicability becomes partial.
$\square$ not comparison-based	Praxis frame remains dominant; Σ -work remains accessible; pseudo-symmetry less likely to stabilize.
Σ/Ψ established early	Upstream interruption: reciprocity can stabilize before chronic Λ accumulates under Θ .
External institutions stabilize roles	Contracts, norms, or institutional interfaces may scaffold Σ/Ψ and constrain $\square$; regime-like drift becomes less likely.
Switch activation marked, bounded, and re-bound	Asymmetry activation may remain viable and dignity-preserving when it is explicitly tied to real Ω/Θ burden and re-bound into Σ/Ψ .
Rival frameworks retain explanatory force	In some scenes, trauma, attachment, symbolic recognition, institutional asymmetry, theological anthropology, or phenomenological alienation may remain more discriminative than PMS-EDEN.
Genuine non-capture cases	Where PMS-EDEN would smooth over distinctions better preserved elsewhere, the model should be narrowed, suspended, or treated as partial.
Strongest applicability condition	Highest discriminative force occurs when Ω is action-relevant, $\square$ becomes comparison-dominant, Σ stays low, Ψ is absent/misbound/externalized, Λ becomes chronic, A stabilizes scripts, and switch drift is available or already active.

Non-normalization clause

Reduced applicability limits explanatory reach, not viability criteria. Persistent cost externalization remains structurally non-viable under PMS criteria as used in this paper regardless of genesis path.

10. Positioning within adjacent frameworks (appendix layer)

This section is repository-facing: it situates PMS-EDEN relative to adjacent theoretical programs, clarifies non-goals, reduces predictable misclassification (psychological, theological, ideological, normative), and preserves rival-framing openness without replacement or superiority claims.

Neighbor	Overlap	Non-equivalence / boundary value
Practice theory	Anti-mentalism; situated enactment; structured conditions.	More operator-minimal + explicit validity gate for application.
Structuration	Structure ↔ practice coupling; reproduction and constraint.	Explicit drift pivot (□ praxis → □ value-relation) + Ω/Θ/Λ consequence legibility.
Ethnomethodology	Order production; accountability surfaces.	More schematic/generative; designed for cross-scene comparability.
Systems theory	Drift, stabilization, regime reproduction.	Praxeological and role-position oriented (Ω gradients); explicit Dignity-in-Practice (D) as viability boundary without moralization.
Pragmatic sociology	Value frames and justification grammars.	Drift modeled as operator carriage failure under Ω/Θ/Λ; dissatisfaction framed as system maintenance cost, not deficit.
Theological contrast	Contrast class only.	Eden as minimal structural test scene, not doctrine or moral anthropology; tragedy defined structurally, not as desert.

Label risk control

If a regime label is predictably politicized or misread, the preferred fix is lower-entropy renaming while preserving the operator definition, paper-internal label discipline, and non-ideological stance.

11. Example-suite schema (repo vignettes; non-instructional)

PMS-EDEN example files are scene-bound demonstrations that follow a fixed schema. They must remain non-coercive, non-diagnostic, and avoid irreversible exposure.

Required block	Purpose
Minimal vignette (scene-bound)	Concrete configuration snapshot (roles/frames), no person-typing.
Why repo-useful (structural focus)	What operator distinction the example demonstrates.
Operator mapping (reduced signature)	Compact operator trace for retrieval/orientation.
Drift position in master trace (optional; 1 line)	Placement in the updated corridor, including switch availability or downstream switch drift where relevant.
Cost layout (Ω under Θ)	Gradients + trajectories; consequence interfaces; asymmetric cost carriage.
Pattern markers (max 2–3)	Selected markers from the pattern library; non-moral.
Switch-drift markers if present	Asymmetry activation, parity-to-exit, responsibility-to-authority; scene-bound and non-diagnostic.
Validity gate reminder	X + reversibility + D.
Readable structural closure (2–5 sentences)	Human-readable summary; no advice, no prescriptions.

Non-instruction constraint

Examples are structural demonstrations, not guides. They must not become optimization, step-by-step “relationship management,” therapy surrogates, or coercive diagnosis-by-template.

12. Implementation notes and citation

The authoritative overlay specification is `PMS-EDEN.yaml` , intended to be loaded after `PMS.yaml` (`PMS_1.3`).

`PMS.yaml` → `PMS-EDEN.yaml`

Technical reference:

PMS-EDEN.yaml – PMS-EDEN Application Profile (Overlay) Specification (`PMS-EDEN_1.2`)

Base dependency:

Final guard sentence

PMS-EDEN does not replace decisions, responsibility, or tragedy. It makes drift and cost geometry legible: where frames convert into comparison, where non-events become steering surfaces, how asymmetry becomes unspeakable yet operative, where asymmetry activation must be marked and re-bound, how parity can become exit, how responsibility can become authority, and why reciprocity can fail structurally without requiring malice.
